World Agricultural Production

Argentina: Estimated Corn Yield Slightly Reduced Due to Low Soil Moisture Reserves

Relative Vegetation Conditions on December 31, 2010

Source: SPOT-VEG data from FAS Crop Explorer
<http://www.pecad.fas.usda.gov/cropexplorer>

subsoil reserves. Rainfall has been scattered and quite variable. Some of the expected corn area may not be planted this season, despite the recent rain in Northern Argentina. The bulk of the corn crop is in pollination now and any additional stress will further limit yield potential and production. Estimates suggest that between 30 and 35 percent of the corn crop is seriously affected by the dryness. All corn areas could use more rain in order to provide some buffer to dryness with replenishment of soil moisture reserves. (*For more information, contact Denise McWilliams at 202-720-0107.*)

The USDA forecasts Argentine corn production for 2010/11 at 23.5 million tons, down 6 percent from last month but 3 percent more than last year. Area is estimated at 3.20 million hectares, unchanged from last month but above last year by about nearly 19 percent. Yield is forecast at 7.34 tons per hectare, compared to a record high in 2009/10 of 8.44 tons per hectare and a five-year average of 7.12 tons. This new estimated yield is 13 percent lower than last year when rains toward the end of the season provided good return from the limited crop area in corn.

Although rains have been timely and consistent when needed in some corn areas, the soil moisture profile reserves in Argentina's core growing regions are very low. Warm temperatures have continued to dry out surface moisture and limit recharge to

Argentina: Soy Output Reduced Due to Low Soil Moisture

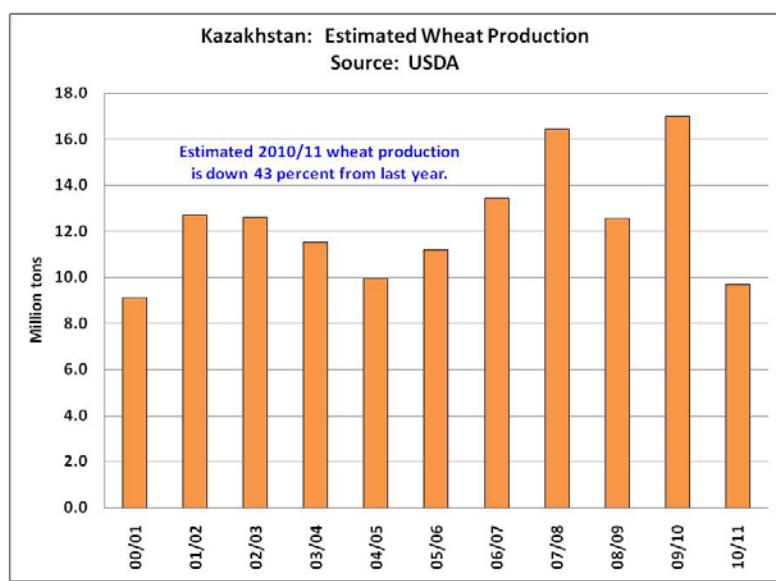

The USDA forecasts Argentine soybean production for 2010/11 at 50.5 million tons, down 3 percent from last month and down 7 percent from last year. Area is estimated at 18.6 million hectares, unchanged from both last month and last year. Yield is forecast at 2.72 tons per hectare, compared to a record high in 2006/07 of 2.99 tons per hectare and a five-year average of 2.68 tons per hectare. This estimated yield is 7 percent below last year.

Good planting conditions early in the season deteriorated with the arrival of dry and warm weather that has parched soil and slowed planting progress. Early-planted soybeans have begun to flower, and although recent rain has provided some relief, about 40 percent of the early-planted crop is in danger of potential yield dipping even further. The early-January rain will allow soy planting to continue in southern Cordoba, central and southern Santa Fe, eastern Buenos Aires (where second-crop soy is planted after wheat), and in portions of northern Argentina. Final sown area will depend in part on the amount of rainfall received before the planting window closes for the season. (*For more information, contact Denise McWilliams at 202-720-0107.*)

Kazakhstan: Wheat Harvest Drops by 43 Percent from Last Year

Severe drought in Kazakhstan's main grain production region sharply reduced grain output for 2010/11. The USDA estimates wheat production at 9.7 million tons, down 1.3 million or 12 percent from last month, and down 7.3 million or 43 percent from last year. Area is estimated at

14.5 million hectares against 14.7 million last year. Yield is estimated at 0.67 tons per hectare (t/ha) compared to 1.16 t/ha last year and the 5-year average of 1.07 t/ha. The month-to-month change in estimated production is based on preliminary harvest data released by the State Statistical Agency of Kazakhstan.

(oblasts) in north-central Kazakhstan: Akmola, Kostanai, and North Kazakhstan. North Kazakhstan oblast typically accounts for about 25 to 30 percent of the country's wheat output, Akmola for 20 to 25 percent, and Kostanai for 25 to 30 percent. Although agricultural technology (including the use of moisture-saving technology) has improved significantly in recent years, virtually none of the wheat in Kazakhstan is irrigated and yield can fluctuate sharply from year to year depending on the weather. (*For more information, contact Mark Lindeman at 202-690-0143.*)

Australia Wheat: Dryness in Western Production Regions, and Excessive Wetness in the East

The USDA estimates Australia wheat production for 2010/11 at 25.0 million tons, the highest harvest in five years. Estimated output is down 0.5 million or 2 percent from last month, but up 3.1 million or 14 percent from last year. Area is forecast at 13.35 million hectares, unchanged from last month but down approximately 5 percent from last year. The yield is forecast at 1.87 tons per hectare, up 20 percent from last year. The harvest as of early January was about 75 percent complete.

Western Australia had one of the worst seasons for winter crops in over 40 years, with dry conditions and above-average temperatures. The dryness significantly cut wheat output for much of the west coast. The major wheat cropping areas on the east coast (including New South Wales, Queensland, Victoria, and South Australia), experienced excellent weather conditions throughout most of the growing season. Above-average rainfall and overall healthy crop conditions in the eastern states boosted potential yields. In late November through December, however, excessively wet conditions across eastern Australia, especially in central-south Queensland and northern New South Wales, caused moderate to excessive flooding. The continued wet weather in these regions resulted in slower crop maturity and hampered harvesting. Crop losses from flooding, physical damage from storms, and likely harvest delays are projected to cause significant downgrade in quality, but minimal loss in overall volume. On the other hand, recent weather conditions have been favorable for harvest in South Australia, Victoria and southern New South Wales. (*For more information, contact Dath Mita at 202-720-1071.*)

Australia: Cotton Planted Area Up From Last Year, but Wetness Could Affect Output

Australia's cotton production for 2010/11 is forecast at 4.0 million 480-pound bales, the same as last month, and up 2.23 million or 125 percent from last year. Harvested area is forecast at 560 thousand hectares, up 360 thousand or 180 percent from last year. Yield is forecast at 1555 kilograms per hectare, down about 20 percent from last year.

Cotton planting is complete. Most cotton growing regions in New South Wales and Queensland experienced above-normal winter and spring rainfall resulting in excellent planting conditions in October and November. The favorable planting conditions, combined with rising cotton prices, led to increased plantings of both irrigated and dryland cotton. Irrigation water is a non-issue since the main dams remain full and farm-gate water allocations went to 100 percent.

In late November through December, excessive wet conditions across eastern Australia, especially in central-south Queensland and northern New South Wales, caused moderate to excessive flooding of some major cotton growing areas. Some flood damage has occurred in low-lying areas but it is too early to assess the full extent. Cool temperatures associated with reduced sunshine have slowed crop establishment and development. A dry warm period is needed for cotton and other summer crops to take advantage of the good rainfall conditions. (*For more information, contact Dath Mita at 202-720-1071.*)

This report uses information from the Foreign Agricultural Service's (FAS) global network of agricultural attachés and counselors, official statistics of foreign governments and other foreign source materials, and the analysis of economic data and satellite imagery. Estimates of foreign area, yield, and production are from the International Production Assessment Branch, FAS, and are reviewed by USDA's Inter-Agency Commodity Estimates Committee. Estimates of U.S. area, yield, and production are from USDA's National Agricultural Statistics Service. Numbers within the report may not add to totals because of rounding. This report reflects official USDA estimates released in the World Agricultural Supply and Demand Estimates (WASDE-490), January 12, 2011.

Printed copies are available from the National Technical Information Service. Download an order form at http://www.ntis.gov/products/specialty/usda/fas_a-g.asp, or call NTIS at 1-800-363-2068.

The FAS International Production Assessment Branch prepared this report. The next issue of World Agricultural Production will be released after 9:30 a.m. Eastern Time, February 9, 2011.

World and Selected Countries and Regions

TABLE 18

The table below presents a 29-year record of the differences between the January projection and the final estimate. Using world wheat production as an example, changes between the January projection and the final estimate have averaged 3.3 million tons (0.6 percent) and ranged from -8.3 to 6.4 million tons. The January projection has been below the final 20 times and above the final 9 times.

RELIABILITY OF PRODUCTION PROJECTIONS

COMMODITY AND REGION	PROJECTION AND FINAL ESTIMATES, 1981/82 - 2009/10 1/

1/ The final estimate for 1981/82-2009/10 is defined as the first December estimate following the marketing year.

2/ May not total 28 if projection was the same as the final.

3/ Includes corn, sorghum, barley, oats, rye, millet, and mixed grain.
